Results from this assay should be interpreted in conjunction with other clinical data available to the clinician. Organism viability cannot be inferred since target rRNA will be detected in the absence of live organism.

This assay is not intended for the evaluation of suspected sexual abuse or for other medico-legal indications. The performance of this test has not been evaluated in patients less than 14 years of age. Because the overall prevalence in children is low, false positive test results can occur, and all specimens that are initially positive should be confirmed.

Methodology: Nucleic Acid Amplification Test (NAAT)
